Dear Hiring Team at ERGO,

I am applying for the Conversational AI and Prompt Engineering position. The role sits at the intersection of NLP, LLM quality assurance, and practical AI deployment — which is precisely where my most recent technical work has been focused.

My Master's thesis at TU Kaiserslautern builds an LLM pipeline using GPT-4o mini (OpenAI API) for automated structured data extraction from knowledge graphs. A significant part of that work is not the model itself but the prompt engineering around it — designing structured prompts that produce consistent, verifiable outputs, handling edge cases where the model drifts, and building a quality assessment workflow to evaluate output correctness against defined criteria. Developing prompts that reliably extract the right information from complex data and then systematically testing whether they do is exactly the core skill this role requires.

The quality assurance dimension is something I take seriously. At Fraunhofer IGC, I built evaluation frameworks to track model performance against quality benchmarks in live industrial environments and investigate output failures before they caused operational problems. I then built a React.js dashboard to surface those AI insights to domain experts who are not ML engineers — translating what the system is doing into something actionable and understandable. That combination of technical rigour and clear communication toward non-technical stakeholders maps directly to what you describe for this role.

At DFKI, I worked closely with researchers to understand their system's failure modes, built tooling to surface those failures clearly, and validated the output with them

iteratively. Collaborating across teams to gather requirements and communicate technical findings without losing the non-technical audience is something I have done in practice, not just in theory.

I want to be transparent: my German is currently at B1 level. I am committed to improving it and I appreciate that ERGO is open to supporting candidates in areas where they are still developing. On the technical side — NLP, prompt engineering, LLM quality evaluation, Python, and cross-functional collaboration — I am ready from day one.

I would be glad to discuss the role further.

Best regards,

Resham Joshi
